ALFIDO TECH | WEBSITE TRAFFIC ANALYSIS

Task 3 • Source file: traffic.csv • Analysis period: 19–25 August 2021

Executive overview

The uploaded dataset contains 226,278 event records across 3,839 distinct link IDs. Events are pageview (142,015), click (55,732) and preview (28,531). The event-level click/pageview count ratio is 39.24% and preview/pageview count ratio is 20.09%. These are descriptive event ratios, not unique-user conversion rates.

Data preparation

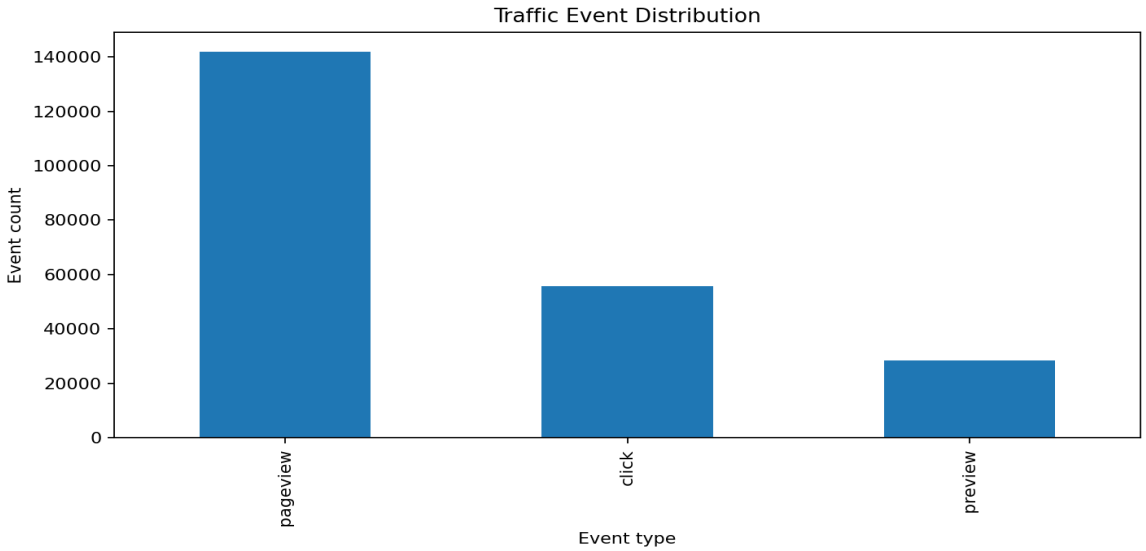

The ZIP contained traffic.csv. The dataset has 226,278 rows and 9 columns. Date was parsed as a date; rows missing event, date or linkid were excluded; missing descriptive dimensions (country, city, artist, album, track and ISRC) were labelled Unknown. The source contained 11 missing country/city values, 37 artist values, 5 album/track values and 7,121 ISRC values. There were no missing event, date or linkid values in the supplied data.

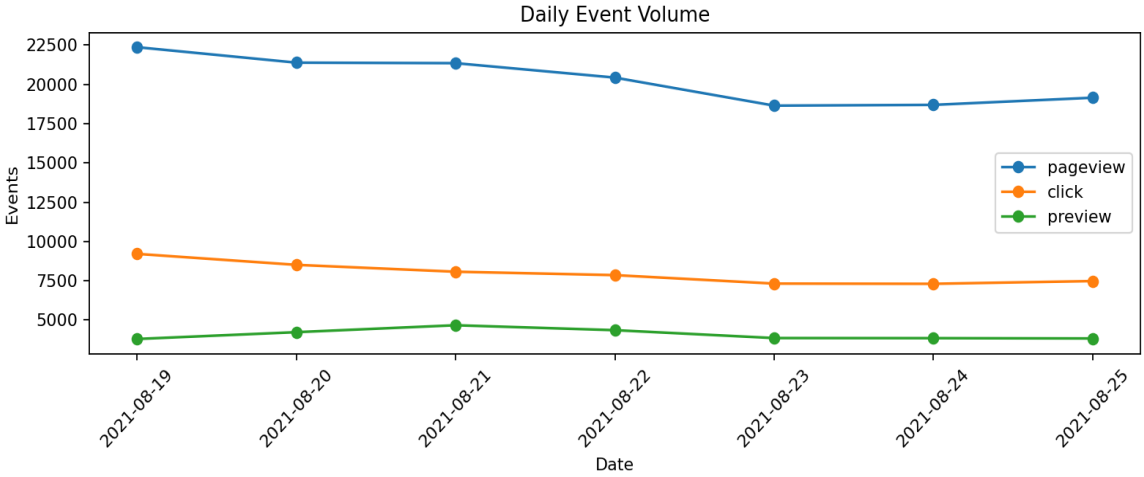

Core available metrics

Metric	Result
Total event records	226,278
Distinct link IDs	3,839
Pageview events	142,015 (62.76%)
Click events	55,732 (24.63%)
Preview events	28,531 (12.61%)

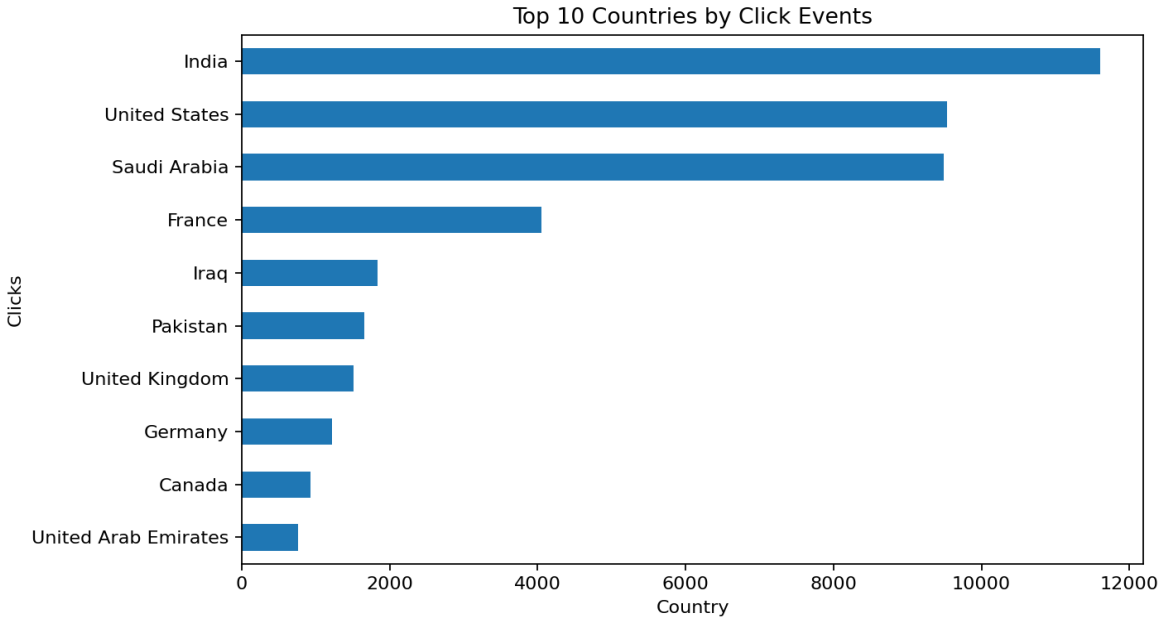

Geographic and content findings

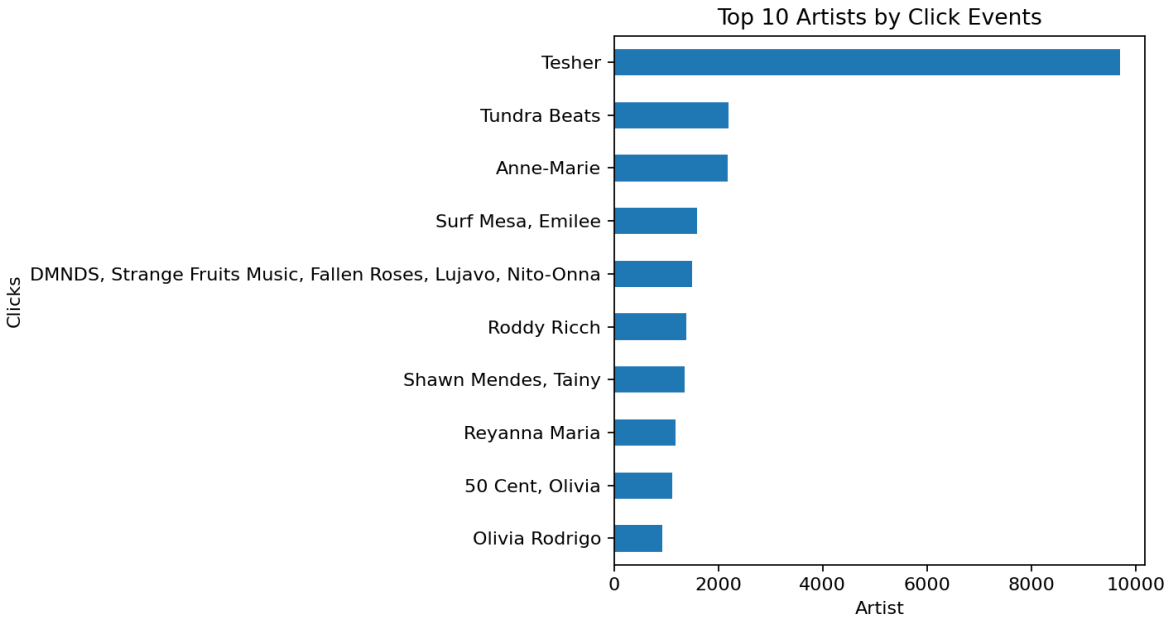

India leads click-event volume (11,609), followed by the United States (9,533) and Saudi Arabia (9,495). The most-clicked artist is Tesher (9,692 clicks); the most-clicked track is Jalebi Baby (9,692 clicks).

Geographic and content visualizations

Five optimization recommendations for Alfido Tech

1. Instrument sessions and users with pseudonymous user IDs, session IDs and precise event timestamps.

2. Capture page URLs, landing/exit page fields, referrers and UTM campaign parameters.

3. Test clearer calls to action and page layouts using pageview-to-click event ratios by link ID as an initial diagnostic.

4. Localize content and campaigns for the leading click markets: India, United States and Saudi Arabia.

5. Promote high-engagement content while measuring downstream outcomes such as completed previews, sign-ups or purchases.

Critical limitations

The file has no user identifier, session identifier, event timestamp (time of day), page URL, referrer or duration. Consequently unique users, sessions, bounce rate, average session duration, user journeys, landing pages, exit pages and referral-source rankings cannot be calculated. The seven-day date range is too short to establish long-term seasonality. The click/pageview ratio is an event-count ratio only and must not be labelled a conversion rate.
